

Half-life: the delta-method line falls below zero

Long-run volatility: division by $1 - p$

— Half-life $h(p) = \ln 0.5 / \ln p$

- - - Delta-method tangent at $\hat{p}$

95% interval for p : [0.9855; 1.0039]

● $\hat{p} = 0.9947, \hat{h} = 131$ days

■ $h(\text{lower end}) = 48$ days

— Long-run volatility $\sqrt{q \hat{w} / (1 - p)}$, $\hat{w}$ fixed

● Estimate 27.3% p.a. (s.e. 10.8)
