

Near the moment boundary, K explodes

- Implied kurtosis K , $\beta = 0.8599$ (full precision)
- - - Implied kurtosis K , $\beta = 0.860$ (rounded)
- $\hat{\alpha} = 0.1206$: $K = 12.1$
- rounded $\hat{\alpha} = 0.121$: $K = 13.5$

Finite fourth moment only below 1

- Normal z_t : $(\alpha + \beta)^2 + 2\alpha^2$
- . - Student-t, $\hat{\nu} = 6.26$: $(\alpha + \beta)^2 + (\kappa_z - 1)\alpha^2$
- GARCH-N estimate: $0.9904 < 1$
- ◆ GARCH-t estimate: $1.0595 > 1$ (no finite K)
